

# Elasticity & OpenStack

Muharem Hrnjadovic  
@al\_maisan

Rackspace International  
Zurich, Switzerland

<https://github.com/al-maisan/p/blob/master/opencld-day-2013.pdf>

# Elasticity

- Definition
- Status quo
- Outlook

<https://encrypted-tbn1.gstatic.com/images?q=tbn:AND9GcQo3A-wgBxNfMBdtpJZVuE8zhD0LDqPmksXP9GAHl0gNMhKxL3pAg>

# auto scaling

[http://media.amazonwebservices.com/AWS\\_Cloud\\_Best\\_Practices.pdf](http://media.amazonwebservices.com/AWS_Cloud_Best_Practices.pdf)

# BUT

- CloudCheckrs User Survey
- Customers with auto-scaling exceptions: 66%
- Invalid
  - Images
  - Security groups
  - Key pairs

# yagni

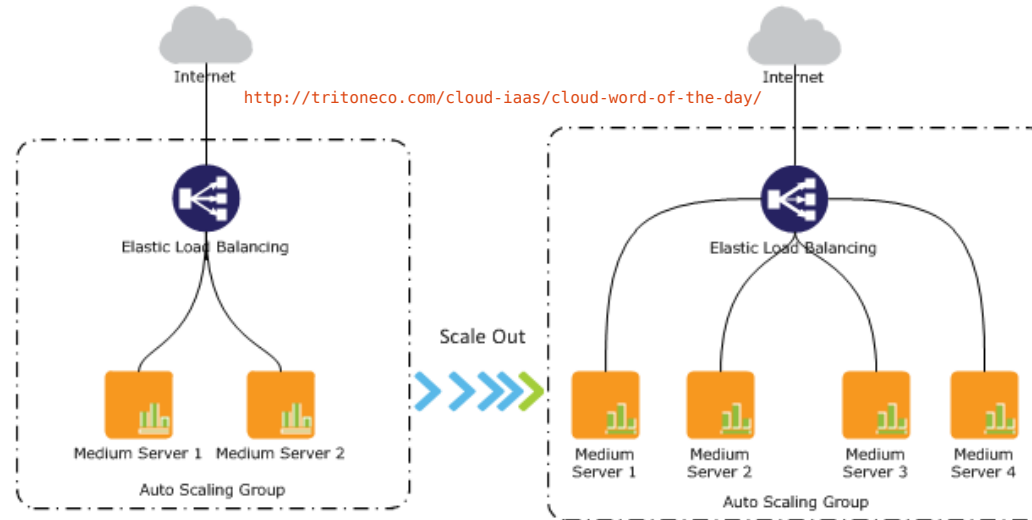

- Know thy workload!
- Complexity is a killer
- Don't bother unless you must

<http://harish11g.blogspot.ch/2013/04/Amazon-Web-Services-AWS-Cost-Saving-Tips-how-Amazon-AutoScaling-can-reduce-leakage-save-costs.html>

# The AS menagerie

- Metric → threshold → alarm → policy
- Policy → launch configuration
  - Adjustment type
  - Change in capacity

# Status quo

- DIY (all or in part)
  - Sophisticated monitoring (**sensu**, **riemann**)
  - portability
- **HEAT**: in your own cloud (at present)
- Higher-level provider e.g. rightscale: multi-cloud

# Let's talk about HEAT

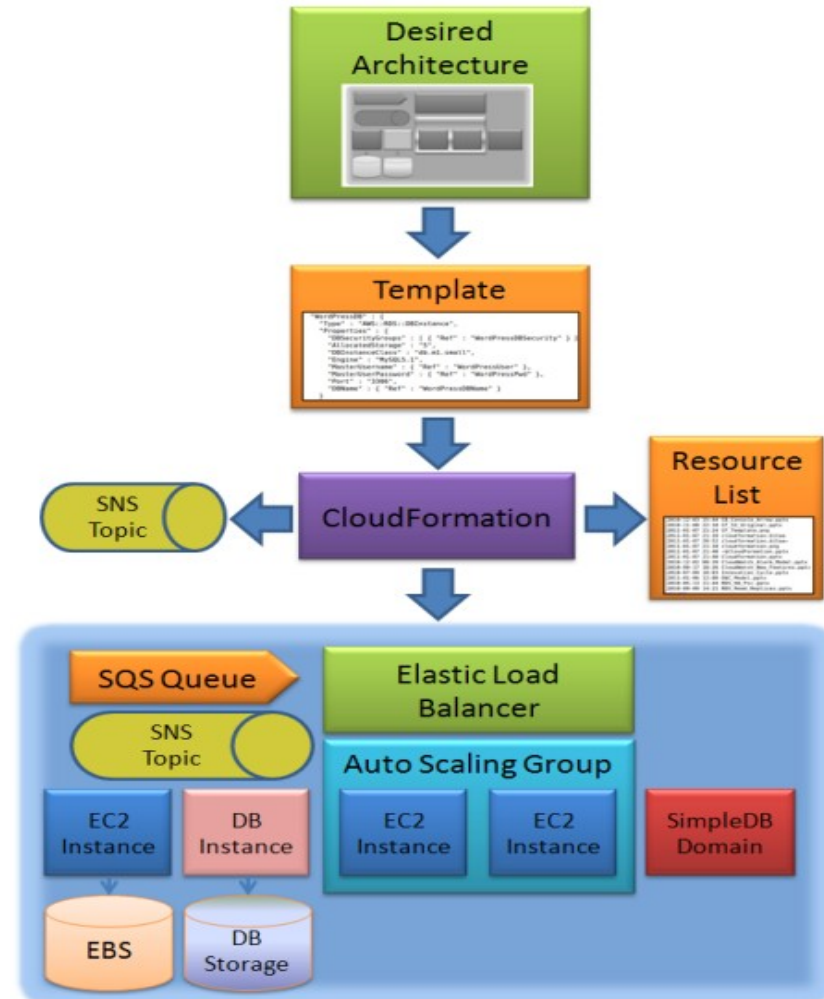

- Integrated project
- **CloudFormation** on OpenStack
- Facilitates deployment of **systems** by specifying
  - Cloud resources
  - Relations between these

# Overview

- Templates rule!
- Advantages of devops practices
  - Revision control
  - Shared knowledge
- Combine with Puppet/chef

<http://aws.typepad.com/aws/2011/02/cloudformation-create-your-aws-stack-from-a-recipe.html>

# Templates

```
{  
  
  "AWSTemplateFormatVersion" : "version date",  
  
  "Description" : "Valid JSON strings up to 4K",  
  
  "Parameters" : {  
    set of parameters  
  },  
  
  "Mappings" : {  
    set of mappings  
  },  
  
  "Resources" : {  
    set of resources  
  },  
  
  "Outputs" : {  
    set of outputs  
  }  
}
```

<http://docs.aws.amazon.com/AWSCloudFormation/latest/UserGuide/template-structure.html>

# HEAT present

- HEAT implemented everything
  - Auto-scaling
  - Cloud watch (monitoring)
  - Load balancing
  - Orchestration
- All-in-one vs. multiple services

# HEAT future

- Break out
  - Auto-scaling → **otter** (Rackspace)
  - Monitoring (ceilometer)
  - LbaaS (quantum)

<http://animaldiscoveryonline.com/animal-pictures/otter-3.jpg>

# more future plans

- Resources and providers
- API + backend
- Native templates
- Multi-cloud support (?)

# Summary

- Early days for **auto** scaling
- Elasticity via
  - HEAT
  - own tooling
  - cloud ops
